

Enterprise Network Security and Firewall Architecture

1. Bastion Host Access:

- The corporate bastion jump-box operates strictly on port 2222 with SSH key-only authentication.
- Password-based SSH access is permanently disabled across all production VPC networks.

2. TLS and Encryption Standards:

- All external ingress endpoints strictly require TLS 1.3 protocol.
- Older protocols (TLS 1.0, 1.1, and 1.2) are explicitly rejected by the Application Load Balancer.

3. VPN Gateway:

- Engineers accessing staging and production databases must connect via the WireGuard VPN gateway.
- Multi-factor authentication (MFA) via hardware security key or TOTP is required every 12 hours.
